

AI Inventory Operations Platform — Startup & Shutdown Guide

PROJECT STARTUP ORDER

Open terminal in project root.

1. Start Docker Desktop

Launch Docker Desktop application first.

Wait until Docker shows:

```
Engine running
```

2. Start n8n Container

```
docker compose up -d
```

Check if running:

```
docker ps
```

Open:

```
http://localhost:5678
```

3. Start React Frontend

Open NEW terminal:

```
cd frontend  
npm run dev
```

Open:

```
http://localhost:5173
```

4. Verify Supabase Connection

Check:

- frontend loads successfully
- alerts table data appears
- no Supabase console errors

5. AWS SES

No service needs to be started manually.

AWS SES works automatically through SMTP when email alerts are triggered.

6. OPTIONAL — Start Cron Workflow in n8n

If using automated scheduling:

- Open workflow
- Toggle workflow to ACTIVE

This enables automated runs.

PROJECT SHUTDOWN ORDER

IMPORTANT: Always stop services after working to save system memory/resources.

1. Stop React Frontend

Inside frontend terminal:

```
CTRL + C
```

2. Stop n8n Container

Open terminal:

```
docker compose down
```

Verify:

```
docker ps
```

n8n should no longer appear.

3. OPTIONAL — Stop Docker Desktop

If not using Docker anymore:

Quit Docker Desktop application.

This saves RAM and CPU.

IMPORTANT COST NOTES

Supabase

Free tier currently sufficient.

No action needed.

AWS SES

AWS SES costs are extremely low.

To avoid unnecessary usage:

- deactivate n8n workflows when not testing
 - avoid infinite cron loops
 - avoid excessive email testing
-

QUICK DAILY WORKFLOW

START

1. Open Docker Desktop
 2. `docker compose up -d`
 3. `cd frontend`
 4. `npm run dev`
-

STOP

1. CTRL + C
 2. `docker compose down`
 3. Quit Docker Desktop
-

IMPORTANT PROJECT URLS

Frontend

`http://localhost:5173`

n8n

`http://localhost:5678`

Supabase

<https://supabase.com/dashboard>

AWS SES Console

<https://console.aws.amazon.com/ses/>

CURRENT TECH STACK

- React + Vite
- TailwindCSS
- Recharts
- Supabase/PostgreSQL
- n8n
- OpenAI API
- AWS SES
- Docker

CURRENT ARCHITECTURE

```
n8n Workflow
  ↓
OpenAI Analysis
  ↓
Supabase/PostgreSQL
  ↓
React Dashboard
  ↓
AWS SES Alerts
```

NEXT DEVELOPMENT PRIORITIES

1. Add risk_level column
2. Build AI Insights page
3. Replace mock chart data

4. Add Supabase realtime
5. Add LangChain intelligence layer
